ClinicalKey 優勢

- 1. 11種資料類型，C/P 值極高
- 2. Quick review :clinical overview/Clinical focus
- 3. Clinical focus: 快篩出臨床資料，節省 寶貴時間
- 4. 遠端連線: 上網即可流暢使用CK
- 5. 超過450萬張圖片及超過6萬隻影片
- 6. 一分鐘做好簡報-內建簡報製作軟體
- 7. 方便製作教材-步驟教學影片資料庫
- 8. 中文介面:方便各職類操作使用
- 9. 輸出中文及多國語言(越南、菲律賓)病人衛教資訊

Clinical Presentation

- History
 - Incubation period is usually 4 to 7 days after mosquito bite; consider in traveler who presents with fever up to 10 days after return ^{1 3}
 - History of prior dengue virus infection is common in endemic areas; this is significant because secondary infection with a different serotype results in more severe disease
 - Presentation varies, ranging from asymptomatic or subclinical (majority of cases), to mild febrile illness, shock, and/or hemorrhage ⁶
 - Begins with abrupt onset of fever (this time period is known as the febrile phase), which persists up to 7 days ²

Infectious tracheobronchitis. Bacterial tracheitis. In a severely immunocompromised patient suffering from a rheumatoid arthritis with vasculitis. She presented with dyspnoea and cough as she was in agranulocytosis secondary to cyclophosphamide treatment. A severe stenosis of the distal trachea (orange arrows) and proximal main bronchi predominant on the left side associated with a fistulous tract (blue arrow) connecting with a paratracheal submucosal abscess was shown during bronchoscopy. This was related to *Pseudomonas aeruginosa*, *Escherichia coli* and *Streptococcus* infection. (A) Axial CT (mediastinal window) at the level of the distal part of the trachea showing the irregular thickening with a 'lucent' on the left side (blue arrow) related to the fistulous tract. (B) Axial CT (lung window) at the same level. (C) 3D reconstruction of the tracheobronchial tree perfectly demonstrating the whole stenosis and the fistula. (D, E) Axial CT at the level of the mainstem bronchi showing a significant decrease of the bronchial thickening after two weeks of antituberculous treatment. (D) before and (E) after treatment.

Short Confirmation Clinical Scenario

- David, 49, was recently diagnosed with pheochromocytoma.
- David's physician, Dr. Banner last treated a patient with this uncommon adrenal tumor many years ago.
- Dr. Banner recalls that specific medications must be given in the pre-operative period in order to protect David from one of several serious peri-operative complications.

Treatment

General Rx

Laparoscopic adrenalectomy (surgical resection for both benign and malignant disease):

1. Preoperative stabilization with combination of alpha-adrenergic blocking agents (prazosin, doxazosin, terazosin, or phenoxybenzamine), beta-blocker, and liberal fluid and salt intake starting 10 to 14 days before surgery. Beta-blockers should be avoided until patients receive adequate alpha-adrenergic blockade for several days to avoid hypertensive crisis due to unopposed alpha stimulation. Amlodipine or verapamil can be added to beta-blockers if blood pressure control is still inadequate. [Table E1-392](#) describes orally administered drugs to treat pheochromocytoma.
2. Hypertensive crisis preoperatively and intraoperatively can be controlled with nitroprusside. [Table E1-393](#) summarizes intravenously administered drugs used to treat pheochromocytoma.

[Latest Treatment Articles](#)

[pheochromocytoma & Treatment Results](#)

- Following this short confirmation, Dr. Banner is confident in medically preparing David for his surgery and protecting him from preventable serious peri-operative events.
- Dr. Banner also reflects on how having rapid access to current, evidence-based information protects both his practice and his patient from potentially significant financial risks resulting from preventable major medical errors.
